

HelpOnSlideShows

<<Navigation(slideshow)>>

You can easily create slide shows using the [Navigation](#) macro.

For a new presentation, start on a new page - we use [HelpOnSlideShows](#) (*this* page) as an example.

For your convenience, there is a [SlideShowTemplate](#) - use it!

Put [Navigation\(slideshow\)](#) on top of that page (looks like you see above) - that creates a link to toggle between slide show and wiki mode, and a link to start the slide show.

Refer to your slides with numbered sub-page links putting some code like that on your top page:

```
* ["/000 Introduction"]
* ["/100 Creating the slides"]
* ...
* ["/900 Last but not least: Running your presentation."]
* ../SlideShowHandOutTemplate
```

💡 Leave some numbers free in between - just for that case you need to insert additional slides later.

💡 Don't use too long page titles - you will see that they look bad (at least in wiki mode due to wrapping of the wiki page title).

This will look like that:

- [HelpOnSlideShows 000 Introduction](#)
- [HelpOnSlideShows 100 Creating the slides](#)
- ...
- [Running your presentation.](#)
- [../SlideShowHandOutTemplate](#)

You may want to put [Navigation\(children\)](#) at bottom of the page - that lists the pages' child pages and looks like you see below:

<<Navigation(children)>>
