

Logs

Error Log

This is a collection of errors produced by the Apache HTTP Server and written to the error log. When you receive an error in your browser, always check the error log for more details on the problem. If you can't find your error log, try consulting [DistrosDefaultLayout](#).

Click on each link for more information about each of these error messages

A	AcceptEx Failed	AcceptExFailed
	Attempt to invoke directory as script	DirectoryAsScript
C	Client denied by server configuration	ClientDeniedByServerConfiguratio n
	Could not determine the server's fully qualified domain name...	CouldNotDetermineServerName
	Could not bind to address 0.0.0.0:80	CouldNotBindToAddress
E	(8)Exec format error: exec of '...' failed	ExecFormatError
F	File does not exist: /usr/local/apache/htdocs/favicon.ico	Favicon
	(38)Function not implemented: core_output_filter: writing data to the network	SendfileNotImplemented
I	Invalid argument: core_output_filter: writing data to the network	InvalidArgumentCoreOutputFilter
	Invalid command 'AuthDigestFile', perhaps misspelled...	InvalidCommandAuthDigestFile
	Invalid method in request \x80\x01\x0\	InvalidMethodHTTPSonHTTP
M	Mixing ports (* and non-* ports)	VirtualHostsMixingPorts
N	(28)No space left on device: Cannot create SSLMutex	IPCExhaustion
	(2)No such file or directory: Failed to enable the 'httpready' Accept Filter	HttpreadyAcceptFilter
P	(13)Permission denied	13PermissionDenied
	(13)Permission denied: /.../.htaccess pcfg_openfile: unable to check htaccess file, ensure it is readable	PcfgOpenfile
	Premature End of Script Headers	PrematureEndOfScriptHeaders
	proxy: ap_get_scoreboard_lb(1) failed...	ApGetScoreboardLb
	proxy: No protocol handler was valid for the URL...	NoProtocolHandlerForURL
S	Session Cache is not configured	SSLSessionCache

Access Log

Some things you may see in your access log, linked to their explanations:

- Requests for sites other than your own: [ProxyAbuse](#)
- Requests from the server to itself: [InternalDummyConnection](#)
- Response sizes don't equal bytes sent: [ResponseSize](#)
- What does the status code mean? [CommonHTTPStatusCodes](#)

Startup Failure

Be aware that if httpd cannot access its log directory (perhaps `/var/log/httpd` or a symlink in `/etc/httpd/logs`) it will not start up or even log a message.
