

# GumpCommandLineOptions

[GumpCommandLineOptions](#).

All Gump scripts (currently) have the same commandline:

```
python gump.py [options] -w {workspace} {project expression}
python bin/XYZ.py [options] -w {workspace} {project expression}
```

Available:

- -w {workspace file} — reference to workspace file.
- {project expresion} — e.g. 'all'

Options:

- ~~⚡~~-debug — turn on Gump debugging
- ~~⚡~~-verbose — not much different than above right now.

Proposed:

- --optimized — only compile things if updated
- --cached — allow cached descriptors (don't download over HTTP, and certainly don't CVS update)
