

AntModules

Ant is composed of a primary project, described principally on the [AntProjectPages](#), as well as a couple of hosted projects. You can browse through their source code by following these links.

- the [svn repositories](#) contains references to the currently active modules of the ant project.
- the [ant-antidote](#) CVS module contains source code for a GUI application called Antidote, which is intended for editing Ant build files. Because antidote was retired on 2005-04-04 the code is no longer maintained and only available in the archive.
