Caching

For starters, there is a page on caching in the official Cocoon docs:
http://cocoon.apache.org/2.1/userdocs/concepts/caching.html

One piece of information which seems to be missing from that doc is that `SourceValidity` is from the Apache Exalibur Source Resolving project with packages `org.apache.excalibur.source` and its subpackages.

JX templates will be cacheable in Cocoon 2.2. There is information about caching JXTemplates in the "Advanced" section of JXTemplateGenerator.

There is information about caching XSP pages at XSPCachingWithCocoonHEAD.

User Questions

- I'd really like to see some information on how to debug caching problems. For instance, if I have a complicated pipeline, is there any way, by looking in the logs, to see which component gave me cached output instead of fresh?

- Is the only way to tell which generators are cachable, by looking in the java code?
  I see that HttpProxyGenerator does not implement CacheableProcessingComponent.
  Do I need to code up a version of HttpProxyGenerator that does implement it in order for it to be cacheable?

- Will
