

Cocoon

Cocoon is an [Apache project](#)

Past

- **CocoonHistory**: Bits and pieces about how this came to be

Present

- **First Steps with Cocoon** : Beginners track on the main Cocoon site.
- **ThePyramidModel** : Cocoon's model for website development
- **LatestRelease**: How to select which release to use and get it
- **Installing** : How to install Cocoon
- **ConfiguringCocoon** : How to configure Cocoon, also see [Caching](#), and [ConnectionPooling](#)
- **Sitemap** : The heart of Cocoon, defines behavior of your site
- **Pipeline** : Cocoon has a pipeline architecture, organised around a [Sitemap](#)
- **Components** : are configured in the sitemap, here's a list of 'em
- **WhatIsFlow** : powerful yet simple to use controller
- **Woody** : The Cocoon Forms subsystem
- **CommandLine** : Using the Cocoon Command Line interface
- **XSP** : Cocoon's JSP equivalent, eXtensible Server Pages
- **DevelopingComponents** : Information for Java developers who want to create their own Cocoon components
- **ExploringTheLogs** : How to make sense of the sometimes huge amount of information logged by Cocoon
- **Links** : links to Cocoon sites, books, products and other (competing) resources on the web, see also [Tutorials](#)

Future

- **Roadmap** : a roadmap for forthcoming changes to Cocoon
- **Blocks**: componentizing Cocoon so that it becomes a proper application framework with its application archives, deployment descriptors, etc
