

FileUploadsInCustomActions

"Note, this code is reportedly (GeoffHoward) **wrong**, but I don't know what's wrong with it. This came from an earlier version of [FileUploadsWithFlow](#). I moved it to its own page and added a link from [FileUploadsWithCocoon2.1](#), because it had nothing to do with flow. – [MarkLundquist](#)

If you have a custom sitemap component that you want to handle an upload request, you can include the following Java code:

```
import org.apache.cocoon.servlet.multipart.*;

...

Request request = ObjectModelHelper.getRequest(obj);
if (request instanceof MultipartHttpServletRequest) {
    Part part = (Part) request.get("upload-file");
    if (part != null) {
        // do something with it
    } else {
        // parameter not found
    }
} else {
    // upload is disabled
}
```
