

PortalToolsCheckAccessAction

CheckAccessAction

The [CheckAccessAction](#) is designed to check if a user has the neccessary rights to access a specific url. It is used where the [PortalTools](#) sitemap is mounted, so there is no need for it to be used in a plugin.

Sample

```
<map:match pattern="plugins/*/**">
  <map:act type="auth-protect">
    <map:parameter name="handler" value="portal-handler"/>
    <map:parameter name="application" value="portal"/>
    <map:act type="check-access-action">
      <map:parameter name="name" value="{ID}"/>
      <map:parameter name="role" value="{role}"/>
      <map:parameter name="url" value="{../1}/{../2}"/>
      <map:mount uri-prefix="plugins/{..../1}" check-reload="yes" src="plugins/{..../1}/sitemap.xmap"/>
    </map:act>
  </map:act>
</map:match>
```
