

Regex Subversion Conversion

The Jakarta Project has decided to move jakarta-regexp to subversion.

We need to export

jakarta-regexp

to SVN and then lock the CVS module.

The resulting repo we need is:

```
/jakarta/  
  /regexp/  
    /branches/ (jakarta-regexp branches)  
    /tags/     (jakarta-regexp tags)  
    /trunk/    (jakarta-regexp HEAD)
```

Upon conversion, the website will be modified to link to the svn.apache.org repository instead of cvs.
