# **HowToLoggingWithChainsaw**

# Log Lenya with Chainsaw v2

Chainsaw is a powerful GUI-based Log viewer. It's a companion application to Log4j and seems to have replaced LogFactor5. Pros are:

- mature application, opensource, clean GUI, easy to install (web start)
- · allows you to easily view the logs of a specific component of your webapp

See also CocoonLog4J and Chainsaw homepage

## Getting Chainsaw v2

#### Web start

- you can launch Chainsaw with Web Start here
- at the startup popup, select "SocketReceiver" on "Port 4445"

#### **Installing Chainsaw locally**

(not tested yet)

## Configuring Lenya (using SocketAppender)

• Set this properties in WEB-INF/web.xml (it's already in there a couple of times, just make sure that it's at least uncommented in one place):

• In WEB-INF/log4j.xconf, comment out what's there and add:

## **Using Chainsaw**

- at the bottom of the window, a tab called "localhost.localdomain" should appear. click on it.
- on the left side, you can select for which component of lenya you want to see the logs (right-click).
- when you want an overview of your webapp, focus on the "Root Logger" and refine the focus on "info" (debug is way too verbose)
- when you analyse a specific component, focus on your component and refine the focus on "debug"
