OverviewPublicationDirectories

All files that belong to a specific publication are organized under one directory tree inside the `pubs` directory. Sometimes it will be helpful to understand what directories and files should be there; especially as long as it will be necessary to dome some tweaks manually on the file because there are no CMS screens yet.

Typically, there will be the following subdirectories:

config	optional	Configuration files
config/*.xconf	optional	XPatch files for cocoon.xconf (to declare input modules etc.)
content	required	Content for your publication
content/rcml	required	Revision Control Information (RCML = Revision Control Markup Language)
content/workflow/history	optional	workflow history files
lenya	required	Override core files (e.g., for use with the fallback module)
xslt	required	Stylesheets
resources/shared/css	required	CSS (Cascading Style Sheet) for your publication
resources/shared/images	required	Put image files and the like here
java/src	optional	Java source files to be compiled as part of the publication
java/lib	optional	Java libs specific to the publication

Note: If you use custom code and libraries in java/lib and java/src, you cannot just copy your publication into the lenya/pubs directory anymore. You need to recompile Lenya together with the publication in that case. Please refer to DeployPublicationHowTo.

Note: For all folders that are not mentioned here it yet has to be discovered what they might be good for. Feel free to add whatever you find out.
