

DeviceData2

Device Data 2.0

The 2.0 release of the device data will be a big change from the 1.X releases. Classification and attribute data will be partitioned into the following data domains:

- Device
- Browser
- OS

These 3 groups allow for better classification and attribute coverage. Domains can be queried independently of each other. Together, the domains represent a better composition of device capabilities than the unified approach of the 1.X device data.

The 2.0 will also change the data format to JSON.
