## SimpleDataLanguage

## Simple Data Language

Created for HiveMind (as a reponse to the NotXMLProposal). **SDL** has the elements, attributes, and nesting present in XML, but is geared towards configuration.

See the <u>reference documentation</u> to learn more and see examples. The syntax is heavily streamlined to meet the needs of providing configuration data to applications, and since configuration data is <u>so</u> vital to HiveMind, it makes sense to address that area directly. Having reworked a lot of HiveMind descriptors (including the master descriptors and many unit tests) from XML to SDL I know I can't go back!

The parser (built on JavaCC), takes the place of a SAX event-driven parser (it emits the same events).

DieterBogdoll: How about a tool which can convert from XML to SDL and, more importantly, from SDL to XML?

HowardLewisShip: Feel free USeriously, the basics of this (as Ant tasks) are already in place to support generation of HiveDoc.

DieterBogdoll: Here it is: http://bogdoll.net/java/hivemind/sdlxml-dist.zip, both versions form sdl to xml and the other way around.
