Developer's Wiki for LARM

Lucene Advanced Retrieval Machine

Note: Due to restrictions from his current employer, the original author had to stop developing LARM. The project is stalled

Mission

The Lucene Retrieval Machine forms a complete and highly scalable search solution for end-users of the Lucene search engine: Capable of intelligently indexing data from various sources, preprocessing of source documents configurable by the end user, up to a best-practice implementation of online search functionality.

It will be based on the Lucene Framework that provides implementations for data aggregation and indexing functionality utilizing the Lucene indexing API, while being easily extensible and constructible by application developers or researchers.

Development

LARM development is currently performed on Sourceforge. See http://larm.sf.net for details.
