

# POPAuthPlugin

## The POPAuth Plugin

Utilizes an access.db style hash file to extend the [SpamAssassin](#) trusted\_networks to 'POPAuth' or 'POP-before-SMTP' hosts by dynamically adding and removing the hosts or networks found in the specified database to [SpamAssassin](#)'s trusted\_networks configuration.

### Code

Add the following files to your local configuration directory (usually /etc/mail/spamassassin):

For Apache [SpamAssassin 3.0.x](#):

- <http://people.apache.org/~dos/sa-plugins/3.0/POPAuth.cf>
- <http://people.apache.org/~dos/sa-plugins/3.0/POPAuth.pm>

For Apache [SpamAssassin 3.1.x](#):

- <http://people.apache.org/~dos/sa-plugins/3.1/POPAuth.cf>
- <http://people.apache.org/~dos/sa-plugins/3.1/POPAuth.pm>

For Apache [SpamAssassin 3.2.x](#):

- The plugin for 3.1 works with 3.2 but **you must configure at least one host (such as your MX's IP address) or network manually using the trusted\_networks config option**. Configuring trusted\_networks manually is recommended anyway.

### How To Use It

Add the above files to your local configuration directory and edit the supplied POPAuth.cf file to suit your setup (ie. change the popauth\_hash\_file setting to point at your 'POPAuth' or 'POP-before-SMTP' access database hash file).
