RazorHowToTell

How can I tell if SpamAssassin is using Razor?

Jesus M Gonzalez-Barahona writes:

'Usually, you have to do nothing in order for SpamAssassin to use Vipul's Razor (except for, obviously, having Razor installed). However, if you wonder whether it is being used or not, run SpamAssassin in debug mode:

```
spamassassin -t -D < /tmp/spam
```

(being /tmp/spam a mail message). If Razor is being used, you'll see some lines like these:

```
debug: Razor is available
debug: Razor Agents 1.20, protocol version 2.
debug: Read server list from /home/jgb/.razor.lst
debug: 72636 seconds before closest server discovery
debug: Closest server is 209.204.62.150
debug: Connecting to 209.204.62.150...
debug: Connection established
debug: Signature: 48e74b8496877ba45072b201b41eebed7038186b
debug: Server version: 1.11, protocol version 2
debug: Server response: Negative
48e74b8496877ba45072b201b41eebed7038186b
debug: Message 1 NOT found in the catalogue.
```

NOTE:
When using SpamAssassin 3.1.7, to get the details described above, I had to use:

```
spamassassin -t -D razor2 < /tmp/spam
```
