QpidCpp

Contributors, please look over coding guidelines in CppTips.

Currently built/tested with g++ on Linux using GNU make (feel free to port it 🙂) For other prerequisites see cpp/README.

Testing guidelines:

- All classes should be unit tested with CppUnit. TODO details on framework,.
- Broker should pass PythonBrokerTests with `./run-tests -I cpp_ignore.tests`

You should never commit unless all the tests are passing.

TODO: implement/describe one-step automated test run.

TODO: Better getting-started info for committers.

TODO: Move info in cpp/README to wiki.
