SolrHttpCompression

Solr does not respect the HTTP headers for compression. Since it is a Web application running on top of a standard Web container, it expects the container to handle compression.

Tomcat

To use Tomcat's native compression, configure the following settings in the Connector section.

For example:

```
<Connector compression="on"
compressableMimeType="text/html,text/xml,text/plain"
compressionMinSize="2048"/>
```

See here for more details.

Jetty
