

SolrProxyConfiguration

Configuring Solr to use a proxy directly (i.e. if you use sharded searches, and you need Solr to see the web via a proxy) is not possible. However, you can configure the proxy in the JVM, and conveniently, Solr uses the [SystemDefaultHttpClient](#) when fetching data, which will respect those settings.

So, if you're using Jetty, it's as simple as this:

```
java -jar start.jar \  
-Dhttp.proxyHost=my.proxy.url.or.ip \  
-Dhttp.proxyPort=1234
```

Don't include the protocol if you use a URL.
