EnhydraVelocity

This is a simple example of how Velocity may be used with Enhydra.

How to set-up:

1. Add the velocity jar and the velocity service classes (see classes dir)
to your classpath. Optionally, you can add this info to the config.mk and start.in
files of your application

2. Add the following line to your Enhydra application conf file:

velocity = "THE FULL PATH TO VELOCITY PROPERTIES FILE"
Example: velocity = "/dave/enhydraApps/VelocityApplication/velocity.properties"

3. Set the path to your template directory in the velocity.properties file:

file.resource.loader.path = "FULL PATH TO THE TEMPLATES DIRECTORY"
Example: file.resource.loader.path = /dave/enhydraApps/VelocityApplication/templates

Have fun...
