

ThriftUsageErlang

Getting started

The Erlang code generated by Thrift uses a number of `Thrift` modules. These modules need to be compiled to be able to use the code generated by Thrift.

Building the Thrift modules in Linux

1. If you haven't done so already [download a snapshot](#) of the Thrift source code and extract it. - [Direct link to the snapshot](#)
2. Navigate to

```
lib/erl/
```

using the terminal of your choice

3. Compile the Thrift modules into BEAM:

```
make
```
