XmlPull

XmlPull API

"Common API for XML Pull Parsing (XmlPull) is an effort to define a simple and elegant pull parsing API that will provide a standardized way to do pull XML parsing from J2ME to J2EE."

"It is a minimalist API: very easy to implement standalone or on top of existing parser. The API allows both fast high level iteration (using next() method) and low level tokenizing (using nextToken() token) and is designed for easy building on top of it SAX, XML pull parsers that uses iterators with event objects, or even DOM implementations. To to support J2ME and real small implementation parsing of DOCDECL is optional (but DOCDECL can be reported if requested)."
