## Working With Code

### Getting the source code

First of all, you need the Lucene source code.

Get the source code using: `git clone https://github.com/apache/lucene-solr/`

### Notes for required Java version

Be sure that you are using an appropriate version of the JDK. Current master branch requires Java 11.

### Unit Tests

Please make sure that all unit tests succeed before constructing your patch: `ant clean test`

To run a single test case from the `lucene/` directory in your working copy: `ant -Dtestcase=NameOfYourUnitTest test`

In case your contribution fixes a bug, please create a new test case that fails before your fix, to show the presence of the bug and ensure it never re-occurs. A test case showing the presence of a bug is also a good contribution by itself.

### ant precommit

Please run `ant precommit` to identify problems that should be addressed before you contribute your changes.

### Creating a patch

Before creating your patch, you may want to get 'master' up to date with the latest from upstream. This will help avoid the possibility of others finding merge conflicts when applying your patch. This can be done with `git pull` if master is the current branch.

If your changes are in your git working tree (i.e. not committed to a branch), then do this:

1. Check to see what files you have modified with: `git status`
2. Add any new files with: `git add src/.../MyNewClass.java`
3. In order to create a patch, just type `git diff HEAD > LUCENE-NNNN.patch`

If your changes are all committed to the current (feature) branch:

1. `git diff master... > LUCENE-NNNN.patch`

If some of your changes are committed to the current (feature) branch but you have working-copy changes too:

1. `git diff {{git merge-base master head> LUCENE-NNNN.patch}}`

This will save a diff into the `LUCENE-NNNN.patch` file. Read the patch file. Make sure it includes ONLY the modifications required to fix a single issue.

## Contributing your work

Patches should be attached to an issue in [Jira](#)

To enable automatic validation of Jira patches, switch the issue's status to "Patch Available" by clicking on the "Enable Patch Review" button near the top of the page. This will enqueue an ASF Jenkins job [PreCommit-LUCENE-Build](#) to run various quality checks on the patch and post a validation report as a comment (by "Lucene/Solr QA") on the issue. Expect a delay of 12 hours or so before the patch validation job actually runs. Note that in order for a patch file to trigger validation, its name must conform to the naming rules outlined here: <https://yetus.apache.org/documentation/in-progress/precommit-patchnames/>

Please be patient. Committers are busy people too. If no one responds to your patch after a few days, please make friendly reminders. Please incorporate others' suggestions into your patch if you think they're reasonable. Finally, remember that even a patch that is not committed is useful to the community.

## Stay involved

Contributors should join the [Lucene mailing lists](#). In particular, the commit list (to see changes as they are made), the dev list (to join discussions of changes) and the user list (to help others).

Please keep discussions about Lucene on list so that everyone benefits. Emailing individual committers with questions about specific Lucene issues is discouraged. See [http://people.apache.org/~hossman/#private\\_q](http://people.apache.org/~hossman/#private_q).

## Getting your feet wet: where to begin?

New to Lucene? Want to find JIRA issues that you can work on without taking on the whole world?

The Lucene/Solr developers use the "newdev" label to mark issues that developers new to Lucene might be interested in working on. The rough criteria used to make this selection are:

- Nobody has done any work on the issue yet.
- The issue is likely not controversial.
- The issue is likely self-contained with limited scope.

To see a list of open Lucene and Solr issues with the newdev label, look at this link <http://s.apache.org/newdevlucenesolr>

**Note:** Fixing these issues may require asking questions on the developer list to figure out what they mean - there is no guarantee that any of these will be either quick or easy.

## Developer tips

For more contribution guidelines and tips, see [DeveloperTips](#)
