

Tapestry5ExceptionPage

How to display your own exception page

As of T5.0.5 it's not documented yet but Tapestry's "ExceptionReport" page is what you have to override. It's mentioned [here](#) (or check the T5 source).

Simply create your own page named [ExceptionReport](#) which implements the [ExceptionReporter](#) interface.

Here's an example ...

[ExceptionReport.java](#)

```
package yourapp.tapestry.pages;

import org.apache.tapestry.services.ExceptionReporter;

public class ExceptionReport implements ExceptionReporter
{
    private String error;

    public void reportException(Throwable exception)
    {
        error = exception.getLocalizedMessage();
    }

    public String getError()
    {
        return error;
    }
}
```

[ExceptionReport.html](#)

```
<html xmlns:t="http://tapestry.apache.org/schema/tapestry_5_0_0.xsd" >
<head>
    <title>Error</title>
</head>
<body>
    Error: ${error}
</body>
</html>
```
