

# AskingAboutIntegrations

Can I get help on integrating [SpamAssassin](#) with [some mail delivery system] by posting on the [SpamAssassin-Users](#) mailing list?

[SpamAssassin](#) is implemented as a filter that can be and is used by nearly every known mail delivery system. (See [UsingSpamAssassin](#)).

If `spamassassin -tD < [message_file]` returns a properly filtered message, then [SpamAssassin](#) is working appropriately. The best messages to use for this test are the samples included with the distribution, [sample-spam.txt](#) and [sample-nonspam.txt](#).

[SpamAssassin-Users](#) (see [MailingLists](#)) is mainly about making the core [SpamAssassin](#) code work well, not on integrating it with other mail platforms. For integration questions, you should check with the folks who support your MTA filter (MIMEdefang, qmail-scanner, spampd, etc), using a forum dedicated to the mail system you're using.

Once you solve the problem, please consider adding info about it to the wiki, such as at [FixingErrors](#).
