Description

Apache Gump is a cross-project continuous integration server. Gump's intention isn't so much to be a CI server but rather a vehicle that makes people look beyond their project's boundaries and helps the projects to collaborate.

Gump is written in Python and supports several build tools and version control systems. The Apache installation of Gump builds ASF as well as non-ASF projects and their dependencies. It started in the Java part of the foundation but also builds projects like APR, HTTPd and OpenSSL.

Issues

There are no issues requiring board attention.

Membership Data

Apache Gump was founded 2004-02-18 (17 years ago) There are currently 16 committers and 10 PMC members in this project. The Committer-to-PMC ratio is 8:5.

Community changes, past quarter:

- No new PMC members. Last addition was Mark Thomas on 2014-12-03.
- No new committers. Last addition was Konstantin Kolinko on 2015-02-11.

Project Activity

The Tomcat community is the only one still using Gump actively and the only activity in Gump is around keeping the infrastructure alive and tweaking things for the benefit of Tomcat builds.

During the past two months Gump has migrated to use OpenJDK 11 rather than OpenJDK 8 for all JVM based builds. During the migration several projects have been removed that are (no longer) needed by the projects actively using Gump.

We will certainly support any other project that wants to get the benefit of the early warning system for backwards incompatible changes Gump provides, but we are not actively recruiting projects.

Releases

Gump has never done any releases. One reason for this is that the ASF installations of Gump work on the latest code base almost all of the time following its "integrate everything continuously" philosophy.

Community Health

There isn't much happening but help is there when anybody needs it.
