

TDK

[I've been using Turbine for 6 months now, and I finally worked out the relation between the Templates, the Actions and the Screens. There are howtos at jakarta.apache.org/turbine/turbine-2/howtos.html but they can be rather impenetrable at first. What I wanted was some text like this:

"One of the main features of Turbine is that java classes called screens will get executed automatically whenever a Template is viewed through the Turbine Engine. Web Forms can specify an action that will be performed on submit and a template that will be used to show the results, thus causing a form submit to lead to the execution of both an Action and a Template."

Probably some kind of diagram would help, but I'm not much of an artist 😞 – SamJoseph]

[Using the TDK 2.2 on Mac OS X](#) – FWIW, I went ahead and jotted some notes on getting TDK 2.2 running on Mac OS X... – [RobLeachman](#)

[Starting a project with TDK 2.2 and Maven](#) – Lester Ward posted this to the list. It looks like gold to me! – [RobLeachman](#)

Just finished installing the TDK. Had everything worked perfectly I would have been done in about 30 minutes (of course it actually took about 10 hours over 3 days).

My project was called turbo1 and these are the specifics of what I was doing wrong.

webapps/turbo1/WEB-INF/build/build.properties as far as I can tell should look something like this (mysql):

```
#this doesn't get transferred right now
tdk.home = /data/tdk-2.2
database.name = turbo1
database = mysql
#The createDatabaseUrl cannot have the database name in it
createDatabaseUrl = jdbc:mysql://localhost/
#buildDatabaseUrl and databaseUrl should have the database name in it
buildDatabaseUrl = jdbc:mysql://localhost/turbo1
databaseUrl = jdbc:mysql://localhost/turbo1
databaseDriver = org.gjt.mm.mysql.Driver
databaseUser = turbine
databasePassword = turbine
databaseHost = 127.0.0.1
```

I had no luck with Mysql-3.23.53 on newapp 'ant init'

```
BUILD FAILED file:C:/tdk-2.2/webapps/newapp/WEB-INF/build/build-torque.xml:302: java.sql.SQLException: General
error: Unknown database 'newapp'
```

is caused by the lines in src/sql/create-db.sql which refer to a database called 'default'. Try typing them in to a mysql console and you'll see what I mean.

Maybe later Mysqls are better. No - I've just checked - DEFAULT is a reserved word in MySQL, so it's a pretty dumb name for a database. It seems to stem from the definition of DEFAULT_DATABASE in /tdk/ancillary/2/src/conf/build.xml; but changing that and rebuilding recreates create-db.sql with the offending lines still there. So I guess that something isn't being rebuilt that needs to be...

> I've just checked - DEFAULT is a reserved word.... it's actually a bug in id-table-schema.xml.patch, check issue TRQS35 in scarab. Note you have to register first. <http://issues.apache.org/scarab/issues/id/TRQS35>

you can download the patch in the attachments tab.
