Getting your first webapp up and running

- [Introduction in the Application Developer Guide](#)
- Chinese translation of the Application Developer Guide (warning: it is for Tomcat 5, which is an old and unsupported version)

Useful links

- [HowTo](#) — Some how-tos assembled here
- [How To / How do I make my web application be the Tomcat default application?](#) — How to make tomcat serve content from www.exampledomain. com instead of www.exampledomain.com/examplewebapp. Basically, just make a directory inside tomcat's webapps directory called ROOT and your content will be served to the root domain www.exampledomain.com.
- [BitNami Tomcat Stack](#): Provides an all-in-one installer, free virtual machines and cloud images for Tomcat.
- [TurnKey Tomcat Appliance](#): Open source installable Live CD based on Ubuntu. Features minimal footprint, automatic security updates, SSL support and an elegant Web administration interface.
