Hide/disable Apache Tomcat server version

Sometimes for security reasons system administrators hide/disable server informations such as web server product name and version. Unlike famous Apache HTTP server Apache Tomcat does not have applicable configuration keys for this, but we can change/remove version information in ServerInfo. properties file which is located in catalina.jar file.

Steps:

- Stop Apache Tomcat server
- Unpack **$CATALINA_HOME$/lib/catalina.jar** or **$CATALINA_HOME$/server/lib/catalina.jar** (*jar xvf catalina.jar org/apache/catalina/util /ServerInfo.properties*)
- Update **ServerInfo.properties** text file. You will see **server.name** and **server.number** keys
- Pack only **ServerInfo.properties** file again into catalina.jar (*jar uvf catalina.jar org/apache/catalina/util/ServerInfo.properties* Be sure not to include org/apache/catalina/util folder structure again)
- Start Apache Tomcat server

(sorry but I could not add new wiki page in HelpForAdministrators section, pls move to appropriate wiki section)
