

ValidatorActionForms

Up to [ValidatorFaq](#)

What's the difference between [DynaValidatorForms](#) and [DynaValidatorActionForms](#)??

Answer(s)

When you configure your forms to be [DynaValidatorForms](#), then struts will choose to use the form you defined in validation.xml with the same name as the action mapping's name attribute. This should also correspond to a form definition in the struts-config form-beans section.

With [DynaActionValidatorForms](#), struts looks for a form definition in validation.xml with the name the same as the path attribute of your action mapping.

i.e. with [DynaValidatorForms](#) you always get the same validation done on a particular struts-config-defined formbean.

With [DynaValidatorActionForms](#) any particular validation definition in validation.xml is executed for a particular URL, the path in the action mapping.
