VfsTestServers

VFS Testing with external Servers

This page collects a number of example configurations and setup instructions for external servers. This is intended to be used with the integration tests, as described on the Apache Commons VFS site.

Samba 3

To test the (sandbox) SMB provider you can export a share with Samba 3 server and connect to it:

Setup a 'vfsusr' login with password 'vfstest'

```
smbpasswd -a vfsusr
```

Configure a new share in Samba by adding the following lines to the configuration:

```
[vfsusr]
comment = VFS Test Directory
path = /home/vfsusr
guest ok = yes
writable = yes
```

OpenSSH

In **/etc/ssh/sshd_config** ensure

```
PasswordAuthentication yes
```

Then you can crate the test directory in the home of any user (of course not root) and use it as the base for testing.
