

HelpOnLists

Lists and Indenting

You can create bulleted and numbered lists in a quite natural way. All you do is inserting the line containing the list item. To get bulleted items, start the item with an asterisk "*"; to get numbered items, start it with a number template "1.", "a.", "A.", "i." or "I.". Anything else will just indent the line. To start a numbered list with a certain initial value, append "#*value*" to the number template.

To nest lists of different levels, you use different depths of indenting. All items on the same indent level belong to the same (sub-)list. That also means that you cannot change the style of a list after you started it.

Definition lists can be created by items of the form {{{<whitespace>term

\$_{renderedContent}

For more information on the possible markup, see [HelpOnEditing](#).

Example

```
If you indent text
  like this, then it is indented in the output
    you can have multiple levels of indent

And if you put asterisks at the start of the line
* you get a
* bulleted
* list
  * which can also be indented
    * to several levels

A numbered list, mixed with bullets:
1. one
1. two
  1. one
    * bullet 1
    * bullet 2
  1. two
1. three
  * bullet
    1. one

Variations of numbered lists:
* Lowercase roman
  i. one
  i. two
* Uppercase roman (with start offset 42)
  I.#42 forty-two
  I. forty-three
* Lowercase alpha
  a. one
  a. two
* Uppercase alpha
  A. one
  A. two
