

# NutchMavenSupport

As well as being released in Binary and Source (the latter only for the 2.x series), all releases of Nutch are now packaged as [Maven](#) dependencies.

Just include the below block of code in your Maven pom.xml.

In addition to this, please see [here](#) for ALL Nutch artifacts on the Sonatype Nexus Maven Repository.

```
<dependency>
<groupId>org.apache.nutch</groupId>
<artifactId>nutch</artifactId>
<version>${nutch.version}</version>
<exclusions>
  <exclusion>
    <groupId>com.sun.jdmk</groupId>
    <artifactId>jmxtools</artifactId>
  </exclusion>
  <exclusion>
    <groupId>com.sun.jmx</groupId>
    <artifactId>jmxri</artifactId>
  </exclusion>
</exclusions>
</dependency>
```

Nutch Maven poms are created by Nutch committers running the command:

```
ant deploy
```

This generates a top-level pom.xml, with the necessary deps. Also, it currently pushes the Nutch staging artifacts to Apache's Nexus repository, which upon successful VOTE'ing, is then pushed to Maven Central.

**N.B** Replace \${nutch.version} above with the version of Nutch you wish to use.
