

BartGuijt

Developer, mostly using Java, XML and OpenSource technology.

Reach me at b.guijt1 at chello dot nl (or bart.guijt at ordina dot nl)

I created the first edition of the QDox block, which is used for example to create Javadoc on-the-fly. QDox parses the Java source(s) and the component emits XML which represents the class' signature including javadoc text (just like the regular Doclet).

We, at Ordina, used Cocoon to build a frontoffice webapp for an insurance company to be used by intermediaries. Cocoon enabled fast development of new insurance products, they are programmed in the system declaratively using all sorts of XML technologies. Very interesting project.

Cheers!
