

# GT2003HackathonCli

Upayavira's mini-talk at the GT2003 Hackathon.

Raw notes taken collaboratively during the talk.

## Short intro about what he has been doing so far

Almost rewriting the CLI, actually...

## Questions and remarks

- What about moving the CLI to Forrest?
  - CocoonBean needs to stay inside Cocoon
  - What would be the benefit of moving away?
  - In the end, we're pretty happy with the way it is, especially if Upa is happy with it
- It's kinda lonely out there... 😊
- Issues with Cocoon and the CLI
  - Reading from the persistent store is much slower than from the memory store (like 10 times)
- Open issues
  - Database access
  - Caching of link gatherer information
  - Ant task integration
  - Usage reports, reporting features
  - Command scheduler
