

JavaScriptInXsl

If you want to embed JavaScript in your ???html.xml, you can use the following technique:

```
<script type="text/javascript">
  <xsl:comment>
    <![CDATA[ log( "mail", )]]>
    &quot;<xsl:copy-of select="$page"/>&quot;;
    <![CDATA[ ]; ]]>
  </xsl:comment>
</script>
```

This script calls a function "log()" with a fixed parameter and a parameter build from a variable \$page.

The function is defined in an external script file, which can be included with

```
<xsl:element name="script">
  <xsl:attribute name="type">text/javascript</xsl:attribute>
  <xsl:attribute name="src">/resources/scripts/logger.js</xsl:attribute>
</xsl:element>
```

or

```
<script type="text/javascript" src="/resources/scripts/logger.js" />
```

in the html <head>.
