

ParameterSelector

A Selector that matches a string in the parameters object passed to it.

```
<map:selector name="parameter" factory="org.apache.cocoon.selection.ParameterSelector"/>
```

```
<map:select type="parameter">
  <map:parameter name="parameter-selector-test" value="{mySitemapParameter}"/>
  <map:when test="myParameterValue">
    <!-- executes iff {mySitemapParameter} == "myParameterValue" -->
    <map:transform src="stylesheets/page/uk.xml"/>
  </map:when>
  <map:otherwise>
    <map:transform src="stylesheets/page/us.xml"/>
  </map:otherwise>
</map:select>
```

The purpose of this selector is to allow an action to set parameters and to be able to select between different pipeline configurations depending on those parameters. - from the ParameterSelector source comments
