

# RequestParamerModule

The RequestParameterModule can be used for matching multiple request parameters.

The `WEB-INF/cocoon.xconf` file entry should look like:

```
<input-modules>
...
<component-instance
  class="org.apache.cocoon.components.modules.input.RequestParamerModule"
  logger="core.modules.input"
  name="request-param"/>
...
</input-modules>
```

Then, in your sitemap, you can use `{request-param:foo}` or `{request-param:bar}` to get the values for parameters foo and bar.

```
<map:match pattern="test.pdf">
  <map:generate
    type="file"
    src="cocoon:/test.xml?foo={request-param:foo}&bar={request-param:bar}"/>
  <map:transform .../>
  <map:serialize .../>
</map:match>
```
