

XmlFormInCocoon2.0.4

I have edited the XMLForm code available in Cocoon 2.1 (CVS) to be compilable against Cocoon 2.0.4 - it is used exactly as explained in the xmlform documentation available at <http://xml.apache.org/cocoon/howto/xmlform-wizard/howto-xmlform-wizard.html>.

The code is largely untested - but I haven't found any problems using it so far.

Many thanks to the authors of xmlform for the code.

Drop the `xmlform-cocoon-2.0.4.jar` file into the `WEB-INF/lib` directory of your webapplication to use it. If you want to compile the source, edit the `build.xml` file to point to the a directory containing all the `WEB-INF/lib` files for Cocoon 2.0.4.
