JcrContentModelSiteStructure

Options:

Use JCR node hierarchy

- One "implicit" hierarchy
- Would probably resemble URL structure - REST-like thinking (one URI for each resource)
- Additional hierarchies possible:
    - Via separate node hierarchies with references
    - Via shared nodes (JSR 283)

Advantages:

- Simple
- Straightforward
- Better performance ❓

Use flat storage with artificial hierarchy

- Either XML stored in a property (like now)
- Or separate node hierarchy:
    - Via references to the content nodes
    - Via shared nodes (JSR 283)

Advantages:

- More flexibility re. content model (e.g. translations with common parent node) without constraining the URI space
