

Token

Purpose

Token is JSF component that renders a hidden input field whose value is the transaction token for the containing form.

Sample

```
<h:form>
  <h:message for="token" />
  ...
  <s:token id="token" />
</h:form>
```

ATTENTION: In purpose to work properly when the page is redisplayed because validation errors occurred, the Token component should be the last input component in the form.
