

MailPoint

Digitalinfo Networks [MailPoint](#) is a high performance, appliance-based spam and email content filtering solution.

Key features:

- Filters spam using an extensive rule-based scoring system and Bayesian heuristics. Filters >95% of spam out-of-the-box, with virtually no false-positives
- Ability to easily leverage several 3rd party RBLs and spam verification services for enhanced accuracy
- Flexible custom content blocking includes blocking on content in the header, subject, or message body, file attachment names or extensions, and network and email address whitelists and blacklists
- A flexible email quarantine ensures that no messages are ever lost
- Appliance based solution means no software to install, and installation is quick and easy
- Easy clustering of appliances for scalability and redundancy
- Security of a hardened Linux OS
- Cost-effective solution with no per-user licensing fees

[MailPoint](#) is positioned between the Internet and your mail servers. Spam and other malware is blocked at your network's edge, keeping it off of your mail servers. More details at <http://www.digitalinfo.net>.
