SitewidePostfixBayes

I can't get Bayes running with postfix!

After following instructions like those at http://advosys.ca/papers/postfix-filtering.html on installing SpamAssassin with postfix, you may find that Bayesian filtering does not function as expected even after installing DB_File and rebuilding the database with **sa-learn --rebuild**. **spamassassin -D --lint** indicates no problems.

In those instructions, SpamAssassin is run via a script triggered by a "filter" line in master.cf. The filter is run by a new user, *postfilter*, rather than as your own user. Changes made to your Bayesian databases are not seen by this user.

You can still setup Bayesian filters systemwide. To do this, see SiteWideBayesSetup .
