

IDAssignment

It's a Good Thing to ensure that there are IDs present the following JSF tags:

- anything that's a [NamingContainer](#)
 - [PanelNavigationMenu](#)
 - [DataTable](#)
 - [NewspaperTable](#)
 - Columns
 - Form
 - Tree
- elements that are "form fields"
 - any sort of input field
 - anything that is a button
- elements that send commands

Why? For portlets it is actually useful to **not** specify an ID on the [NamingContainer](#) so that it is automatically assigned using a dynamic namespace. That way you can have two instances of the same portlet on a page and the HTML ids will be different. --DaveBrondsema
