

CassandraCli

Use cqlsh Instead

The Cassandra CLI is a holdover from the pre-CQL Thrift API. You should migrate to cqlsh, which supports everything you could do from the CLI.

[cqlsh documentation is here.](#)

Upgrading and wondering how your Thrift data maps to CQL? See these three articles:

- [CQL for Cassandra experts](#)
- [A thrift to CQL upgrade guide](#)
- [Does CQL support dynamic columns and wide rows?](#)

The CLI was formally deprecated starting with Cassandra 2.1 and removed in 3.0.
