

GitTransition

Switching to Git For Committers

Cassandra is transitioning from subversion to git. See <https://issues.apache.org/jira/browse/INFRA-4254> for the latest status on this.

How do I commit now?

First, clone the repository *with your username in the URL*

```
git clone https://<username>@git-wip-us.apache.org/repos/asf/cassandra.git
```

Github

Log into your Github account, visit <https://github.com/apache/cassandra>, and mash the "Fork" button.

If you need to connect an existing local repository:

```
$ git remote add github ssh://git@github.com/<username>/cassandra.git  
$ git fetch github
```

To publish a branch for review (for a checkout of the branch):

```
$ git push github <branch name>
```

If you later wish to delete this remote branch (say after it's been reviewed, merged, etc):

```
$ git push github :<branch name>
```
