Using JBoss to Authenticate Users

The **JB'_*ossAuthenticator** class is provided to let juddi deployments on JBoss use a server security domain to authenticate users.

To use this class you must add the following properties to the juddi.properties file:

```
juddi.auth=org.apache.juddi.auth.JBossAuthenticator
juddi.securityDomain=java:/jaas/other
```

The first one will tell juddi to use this class as the_ 'Authenticator*. The second one, tells the *'JB'**ossAuthenticator** where to lookup the security domain it will use to perform the authentication.

JBoss creates one security domain for each application policy element on the $JBOSS_HOME/server/default/conf/login-config.xml file, and it bounds it to the server JNDI tree with the name java:/jaas/*application-policy-name*. If a lookup refers to a non existent application policy it falls to the default one, named other. Window size: x
