

Tapestry5HibernateGridDataSource

Using [HibernateGridDataSource](#)

One of the easiest way to use the [Grid Component](#) with Hiberante, is to use the [HibernateGridDataSource](#) class, from the tapestry-hibernate module.

Consider this snippet of a page:

```
<t:grid t:source="list"/>
```

The Java class associated to the page is simply:

```
import org.apache.tapestry5.hibernate.HibernateGridDataSource;
...
@Inject
private Session session;

public GridDataSource getList() {
    return new HibernateGridDataSource(session, Entity.class);
}
```

Note

There is a bug with new versions of Hybernate and the implementation of [HibernateGridDataSource](#), that causes a [ClassCastException](#). The bug should be fixed in Tapestry 5.2.
