

Tapestry5HowToIncludeJavaScript

When you include your own [JavaScript](#) functions in a page or component, you have to take care that the formatting doesn't go awry. So I recommend you use the following approach (pay special attention to the comment tags at the start and end of the script tags):

```
<script type="text/javascript" language="JavaScript">
    var myValue = '${prop:value}'; // before the comment so Tapestry sees it!
<!-- //
    // Toggle the display of a set of elements between show and hide
    function toggle() {
        for ( var i=0; i < arguments.length; i++ ) {
            $(arguments[i]).style.display = ($(arguments[i]).style.display != 'none' ? 'none' : '' );
        }
    }
// -->
</script>
```
