

IssueTracking

Issue Tracking

Issue tracking takes place on the [Apache JIRA](#) instance.

Committers needing developer-level access to JIRA should create an account there, then mail the [developer list](#) to request that your account be granted the needed permissions.

Commits that are targeted against issues on JIRA should start the log message with the JIRA id and title, followed by any additional comment, e.g.

```
HTTPCLIENT-1024:  cache does not validate multiple cached variants  
Cache revalidation of entries now sends etags of all cached variants  
on the conditional request.  
Contributed by ....
```

Formatting the commits this way will allow JIRA to automatically pick them up and link them from the issue. For example: <https://issues.apache.org/jira/browse/HTTPCLIENT-1024?page=com.atlassian.jira.plugin.ext.subversion:subversion-commits-tabpanel>.
